Team Member 2:

Name: Yamuna R

Registered Email ID: rajathavmu2005@gmail.com

Team Member 3:

Name: Sathana S

Registered Email ID: sathu09122005@gmail.com

User Story:

The Multi-Line Insurance Policy and Claims Management System is designed to provide a centralized Salesforce-based solution for managing Vehicle, Property, and Life Insurance policies and claims. The system enables insurance agents to create and manage policy information using a flexible data model with policy-specific Record Types and Field Sets.

Guided Screen Flows simplify policy quoting, while Apex automation calculates premiums based on policy and vehicle details. Claims are automatically routed to the appropriate queue based on policy type, and high-value claims are processed through an approval workflow involving Senior Adjusters and Claims Managers.

An LWC-based Claims Dashboard provides adjusters with a focused view of their assigned claims, including claim amount, policy type, policy holder, status, and days open. This system improves policy processing efficiency, claim handling, data accuracy, operational visibility, and customer service.

1. INTRODUCTION

1.1 Project Overview

The Multi-Line Insurance Policy and Claims Management System is a Salesforce-based solution developed to manage Vehicle, Property, and Life Insurance policies and claims within a single centralized platform. The system replaces manual and fragmented insurance processes with an organized and automated approach.

The system allows insurance agents to create and manage policies using Custom Objects, Record Types, Field Sets, and Screen Flows. It also uses Apex automation to calculate policy premiums based on policy details and automatically routes claims to the appropriate queue according to the policy type.

For claims management, the system provides an LWC-based Claims Dashboard that helps claims adjusters view important details such as claim number, policy type, policy holder, claim amount, status, and days open. High-value claims are also handled through a structured approval process.

Overall, the system helps to reduce manual work, improve data accuracy, speed up policy and claim processing, and provide better visibility and customer service.

1.2 Purpose

The purpose of the Multi-Line Insurance Policy and Claims Management System is to provide a centralized and automated Salesforce-based platform for managing multiple insurance products such as Vehicle, Property, and Life Insurance.

The system is designed to simplify policy creation and quoting, automate premium calculation, route claims to the appropriate teams, and manage high-value claim approvals efficiently. It also provides claims adjusters with better visibility of assigned claims through a Lightning Web Component (LWC) based dashboard.

By replacing manual and fragmented processes with Salesforce automation, the system helps improve data accuracy, processing efficiency, security, operational visibility, and customer service.

2. IDEATION PHASE

2.1 Problem Statement

Insurance companies handle different policies such as Vehicle, Property, and Life Insurance. Manual and separate processes make policy creation, premium calculation, and claim handling slow and inconsistent.

This project provides a centralized Salesforce solution to automate these processes and improve efficiency.

2.2 Empathy Map Canvas

User Persona: Insurance Claims Adjuster

- **Think & Feel:** Concerned about claim delays and workload.
- **Hear:** Customer concerns about claim resolution.
- **See:** Multiple claims and approval statuses.
- **Say & Do:** Reviews claims and follows up on approvals.
- **Pain:** Manual processing and limited visibility.
- **Gain:** Automated processing, faster approvals, and a Claims Dashboard.

2.3 Brainstorming & Idea Prioritization

Ideas Considered:

- Manual Registers
- Spreadsheet Tracking
- Standalone Portal
- Salesforce CRM

Final Selection:

Salesforce CRM was selected because it provides **automation, scalability, centralized data management, and better reporting** for insurance policies and claims.

3. REQUIREMENT ANALYSIS PHASE

3.1 Customer Journey Map

Customer Journey:

Policy Selection → Policy Details Entry → Premium Calculation → Policy Creation → Claim Submission → Claim Routing → Claim Review → Approval → Claim Status Update

This journey shows how the customer's policy and claim are processed through the Salesforce system from policy creation to final claim handling.

3.2 Solution Requirements

Functional Requirements

- Create and manage **Policy and Claim** records.
- Support **Vehicle, Property, and Life Insurance**.
- Use **Screen Flows** for policy quoting.
- Calculate premiums automatically using **Apex**.
- Automatically route claims to the appropriate **Claim Queue**.
- Provide an **Approval Process** for high-value claims.
- Display assigned claims using an **LWC Claims Dashboard**.

Non-Functional Requirements

- **Security:** Only authorized users should access policy and claim data.
- **Performance:** Flows, Apex, and dashboard should work efficiently.
- **Scalability:** System should support multiple insurance types and future expansion.
- **Usability:** The system should be simple and easy for agents and adjusters to use.
- **Data Accuracy:** Validation rules should maintain correct and consistent data.

3.4 Technology Stack

Layer	Technology
UI	Salesforce Lightning, LWC
Logic	Salesforce Flows, Apex
Database	Policy, Claim, Contact, User
Automation	Record-Triggered Flows, Validation Rules, Approval Process
Security	Permission Sets, Sharing Rules
Testing	Apex Test Classes

4. PROJECT DESIGN PHASE

4.1 Problem–Solution Fit

Salesforce is suitable for this project because it provides a centralized and automated platform for managing insurance policies and claims.

Using Screen Flows, Record Types, Field Sets, Apex, Approval Processes, and LWC, the system simplifies policy quoting, premium calculation, claim routing, approval, and claim management.

4.2 Proposed Solution

The proposed solution is a **Salesforce-based Insurance Management System** that manages Vehicle, Property, and Life Insurance policies and claims in one platform.

The solution uses **Record Types and Field Sets** for different policy types, **Screen Flows and Apex** for quoting and premium calculation, **Record-Triggered Flows** for claim routing, **Approval Processes** for high-value claims, and an **LWC Dashboard** for claim monitoring.

4.3 Solution Architecture

The system architecture connects different Salesforce components to manage the complete insurance process.

Architecture Flow:

User / Insurance Agent

Salesforce Lightning UI / Screen Flow

Policy & Claim Objects

Apex + Record-Triggered Flows + Approval Process

Claims Dashboard (LWC) + Reports

This architecture provides centralized policy management, automated claim processing, and better visibility.

5. PROJECT PLANNING & SCHEDULING

5.1 Project Planning

The project follows the **Agile methodology** for systematic development.

- Requirements are divided into **Epics and User Stories**.
- Each User Story is assigned **Story Points**.
- Development is divided into **Sprints**.
- **Velocity** is used to track the work completed in each sprint.

Product Backlog & Sprint Schedule

Sprint	User Story	Task	Story Points	Priority	Team Member
Sprint 1	US-01	Create Policy and Claim Objects	5	High	Prakash G
Sprint 1	US-02	Configure Record Types & Field Sets	5	High	Ragul T
Sprint 2	US-03	Create Auto Quoting Screen Flow	5	High	Yamuna R
Sprint 2	US-04	Premium Calculation using Apex	5	High	Sathana S
Sprint 3	US-05	Automate Claim Routing	5	High	Prakash G
Sprint 3	US-06	Create Claims Dashboard using LWC	5	High	Ragul T

Sprint	User Story	Task	Story Points	Priority	Team Member
Sprint 4	US-07	Configure Claim Approval Process	5	High	Yamuna R
Sprint 4	US-08	Security, Sharing & Testing	5	High	Sathana S

Project Tracker, Velocity & Burndown Chart

Sprint	Total Story Points	Duration	Story Points Completed
Sprint 1	10	6 Days	10
Sprint 2	10	6 Days	10
Sprint 3	10	6 Days	10
Sprint 4	10	6 Days	10

Velocity:

The team completed the planned story points in each sprint. The project maintained consistent progress throughout all four sprints.

6. PROJECT DEVELOPMENT PHASE

What You'll Learn

- Data Modelling
- Fields and Relationships
- Lightning App Builder
- Record-Triggered Flows
- Apex
- Salesforce Automation

Milestone 1: Core Data Model & Policy Configuration

1. Create Policy Custom Object

A custom Policy object is created in Salesforce to store and manage insurance policy information for Vehicle, Property, and Life Insurance.

Configure Policy Record Types

2. Create Record Types for Policy

Three Record Types are created in the Policy object to manage different types of insurance:

- Vehicle
- Property
- Life

These Record Types help organize policy-specific information and processes separately.

Create Field Sets for Policy

3. Configure Policy Field Sets

Field Sets are created to display fields based on the selected insurance type:

- Vehicle: VIN, Model Year
- Property: Square Footage, Year Built
- Life: Beneficiary Name, Policy Term Months

This allows each policy type to display only its relevant information.

The screenshot shows the Salesforce Setup interface for the 'Policy' object. The 'Field Sets' section is active, displaying a table with 3 items sorted by Field Label. The table columns are FIELD LABEL, API NAME, CREATED BY, MODIFIED BY, and DESCRIPTION. The items are Life, Property, and Vehicle, each with a description 'In the policy object'.

FIELD LABEL	API NAME	CREATED BY	MODIFIED BY	DESCRIPTION
Life	Life	Ragul T, 01/10/2026, 7:54 pm	Ragul T, 01/10/2026, 7:59 pm	In the policy object
Property	Property	Ragul T, 01/10/2026, 7:46 pm	Ragul T, 01/10/2026, 7:53 pm	In the policy object
Vehicle	Vehicle	Ragul T, 01/10/2026, 1:38 pm	Ragul T, 01/10/2026, 7:37 pm	In the policy object

Create Policy Custom Fields

4. Configure Policy Fields

Custom fields are created in the Policy object to store policy-specific information such as:

- VIN
- Model Year
- Square Footage
- Year Built
- Beneficiary Name
- Policy Term Months

These fields help store the required details for Vehicle, Property, and Life Insurance policies.

Create Claim Custom Object

5. Create Claim Object

A custom **Claim** object is created in Salesforce to store and manage insurance claim details. It is connected with the **Policy** object to identify the policy related to each claim.

Configure Claim Record Types & Fields

6. Configure Claim Details

The **Claim** object is configured with Record Types to support different insurance claims:

- **Accident**
- **Property**
- **Life**

Required fields such as **Claim Amount**, **Claim Status**, **Policy**, **Approval Status**, and other **claim details** are configured to manage the claim process effectively.

AutoQuoting Screen Flow

7. Create AutoQuoting Flow

An **AutoQuoting Screen Flow** is created to simplify the insurance policy quoting process. The flow collects the required customer and policy details and creates the policy record based on the selected insurance type.

VIN Validation Rule

8. Create VIN Validation Rule

A **Validation Rule** is created for Vehicle Insurance to ensure that the **VIN** contains exactly **17 characters**. This prevents invalid vehicle information from being saved in the Policy record.

Premium Calculator using Apex

9. Create PremiumCalculator Apex Class

An Apex class named **PremiumCalculator** is created to automatically calculate the insurance premium based on the policy details. It is used with the AutoQuoting Flow to provide automated premium calculation.

Integrate PremiumCalculator with AutoQuoting Flow

10. Premium Calculation Integration

The **PremiumCalculator Apex action** is integrated into the **AutoQuoting Flow**. The flow sends the policy details to the Apex class, calculates the premium, and uses the calculated value during policy creation.

Claim Routing using Record-Triggered Flow

11. Create Claim Routing Flow

A **Record-Triggered Flow** is created on the **Claim** object to automatically route new claims to the appropriate queue based on the related Policy Type.

- Vehicle → **Auto Claims Queue**
- Property → **Property Claims Queue**
- Life → **Life Claims Queue**

This reduces manual claim assignment and improves claim processing.

Claims Dashboard using LWC

12. Create Claims Dashboard

An LWC-based Claims Dashboard is created to help Claims Adjusters view and manage their assigned claims. The dashboard displays important details such as **Claim Number**, **Policy Type**, **Policy Holder**, **Claim Amount**, **Status**, and **Days Open**

```
1 <template>
2   <lightning-card title="My Assigned Claims Dashboard" icon-name="standard:claim">
3     <div class="slds-m-around_medium">
4       <lightning-combobox>
5         name="policyFilter"
6         label="Filter by Policy Type"
7         value="All"
8         options={policyTypeOptions}
9         onchange={handleFilterChange}
10        class="slds-m-bottom_medium"
11      ></lightning-combobox>
12
13
14      <template if:true={visibleClaims}>
15        <div class="slds-grid slds-wrap slds-grid_pull-padded">
16          <template for:each={visibleClaims} for:item="claim">
17            <div key={claim.claimId} class="slds-col slds-size_1-of-1 slds-medium-size_1-of-2 slds-large-size_1-of-3 slds-p-horizontal_small">
18              <c-claim-title-lwc claim-data={claim}></c-claim-title-lwc>
19            </div>
20          </template>
21        </div>
22        <p class="slds-m-top_medium slds-text-heading_small">Total Claims Assigned: {visibleClaims.length}</p>
23      </template>
24      <template if:false={visibleClaims}>
25        <p>No claims currently assigned to you.</p>
26      </template>
27    </div>
28  </lightning-card>
29 </template>
```

ClaimsAdjusterController Apex Class

13. Create ClaimsAdjusterController

An Apex class named **ClaimsAdjusterController** is created to retrieve claim information for the logged-in Claims Adjuster. The retrieved data is displayed in the **LWC Claims Dashboard** for easy claim monitoring and management.

Claim Tile LWC Component

14. Create Claim Tile Component

A **Claim Tile LWC component** is created to display individual claim details in a simple card format. It shows important information such as **Claim Number, Policy Type, Claim Amount, Status, and Days Open**.

The Claim Tile component is used inside the **Claims Dashboard** to make claim information easy to view.

High Value Claim Approval Process

15. Configure Claim Approval Process

A High Value Claim Approval Process is created for claims where the **Claim Amount** is greater than 50,000.

The claim is sent through two approval levels:

Senior Adjuster → Department Manager

This ensures that high-value claims are properly reviewed before approval.

Approval Status Field

16. Configure Approval Status

An **Approval Status** field is created in the **Claim** object to track the current approval stage of a claim.

Picklist Values:

- New
- Submitted for Approval
- Approved
- Rejected

This field helps users easily identify the approval status of each claim.

Automatic High-Value Claim Submission

17. Create Record-Triggered Flow for Approval

A **Record-Triggered Flow** is created on the **Claim** object to automatically submit high-value claims to the **High Value Claim Approval** process.

When the required claim condition is met, the flow uses the **Submit for Approval** action and sends the Claim record to the configured approval process.

Claim Review & Approve/Reject Flow

18. Configure Claim Review Flow

A **Claim Review Flow** is created to allow the approver to review claim details and select **Approve or Reject**. Based on the selected decision, the claim status is updated accordingly.

Configure Permission Sets

19. Role-Based Access Control

Permission Sets are configured to provide different access levels for **Insurance Agents, Claims Adjusters, and Managers**. This ensures that each user can access only the features required for their role.

The screenshot shows the Salesforce Setup interface for Permission Sets. The left sidebar contains navigation options: Setup, Home, Object Manager, Users, Permission Set Groups, Permission Sets (selected), Custom Code, and Custom Permissions. The main content area is titled 'Permission Sets' and includes a search bar and a list of permission sets. The list has columns for Action, Permission Set Name, Description, and License. The table shows 12 permission sets, including 'ActorCASCPermSet', 'Agentic Near Core CRM', 'Agentic Near Core Marketing', 'Agentic Near Core Personalization', 'Agentic Near Core Provisioning', 'Authenticated Payer', 'Buyer', 'Buyer Manager', 'C2CAnalyticsStoragePermSet', 'C2CCasualtyPermSet', 'C2CDataDetectMetabolismIntegrationUser', and 'Cloud Integration User'. The bottom of the screen shows a Windows taskbar with the date and time as 10:52 PM on 02-10-2026.

Action	Permission Set Name	Description	License
Clone	ActorCASCPermSet		Cloud Integration User
Clone	Agentic Near Core CRM	Allows the integration user to use crm features	Cloud Integration User
Clone	Agentic Near Core Marketing	Allows the integration user to use marketing features	Cloud Integration User
Clone	Agentic Near Core Personalization	Allows the integration user to use personalization features	Cloud Integration User
Clone	Agentic Near Core Provisioning	Allows the integration user to manage connections between tenants	Cloud Integration User

Clone	C2CDataDetectMetabolismIntegrationUser		Cloud Integration User

State-Based Sharing Rules

20. Configure Claim Sharing Rules

State-Based Sharing Rules are configured for the **Claim** object so that Claims Adjusters can access claims based on the policy holder's assigned state. This provides secure and controlled access to claim records.

The template configures sharing based on states such as **CA** and **TX**, with **Read/Write** access

Apex Test Class

21. Test ClaimsAdjusterController

An Apex test class named **ClaimsAdjusterControllerTest** is used to test the functionality of the **ClaimsAdjusterController**. It verifies that claim details are retrieved correctly and helps validate the Apex code before deployment.

7. FUNCTIONAL & PERFORMANCE TESTING

The system was tested to ensure that all major functionalities work correctly. **Policy creation, premium calculation, claim routing, approval process, Claims Dashboard, security, and Apex functionality** were verified during testing.

The testing confirms that the system performs the required insurance policy and claim management operations successfully.

8. ADVANTAGES & DISADVANTAGES

Advantages

- Centralized management of **Vehicle, Property, and Life Insurance**.
- Automated **premium calculation and claim routing**.
- Faster claim processing through **Approval Process**.
- Better visibility using **LWC Claims Dashboard**.
- Improved data accuracy and secure access.

Disadvantages

- Requires proper Salesforce configuration and maintenance.
- Multiple Flows, Apex classes, and LWC components increase development effort.
- Users need basic Salesforce knowledge to operate the system effectively.

9. CONCLUSION

The **Multi-Line Insurance Policy and Claims Management System** provides a centralized Salesforce solution for managing **Vehicle, Property, and Life Insurance** policies and claims.

The system uses **Flows, Apex, Approval Processes, LWC, and security features** to reduce manual work, improve data accuracy, and make policy and claim processing more efficient.

10. FUTURE SCOPE

The project can be enhanced in the future by adding:

- **External system integration** for real-time insurance verification.
- Support for **additional insurance products**.
- **Advanced analytics and dashboards** for better reporting.

- **Mobile access** for agents and claims adjusters.
- **AI-based assistance** for policy and claim processing.
-

11. APPENDIX

The following components were developed and configured as part of the project:

- **Objects:** Policy, Claim, Contact, User
- **Record Types:** Vehicle, Property, Life; Accident, Property, Life
- **Automation:** Screen Flows, Record-Triggered Flows, Approval Processes
- **Apex:** PremiumCalculator, ClaimsAdjusterController
- **LWC:** Claims Dashboard, Claim Tile
- **Validation:** 17-character VIN Validation
- **Security:** Permission Sets, State-Based Sharing Rules
- **Testing:** ClaimsAdjusterControllerTest
- **Reporting:** Claims Dashboard and Salesforce Reports/Dashboards

THANK YOU
